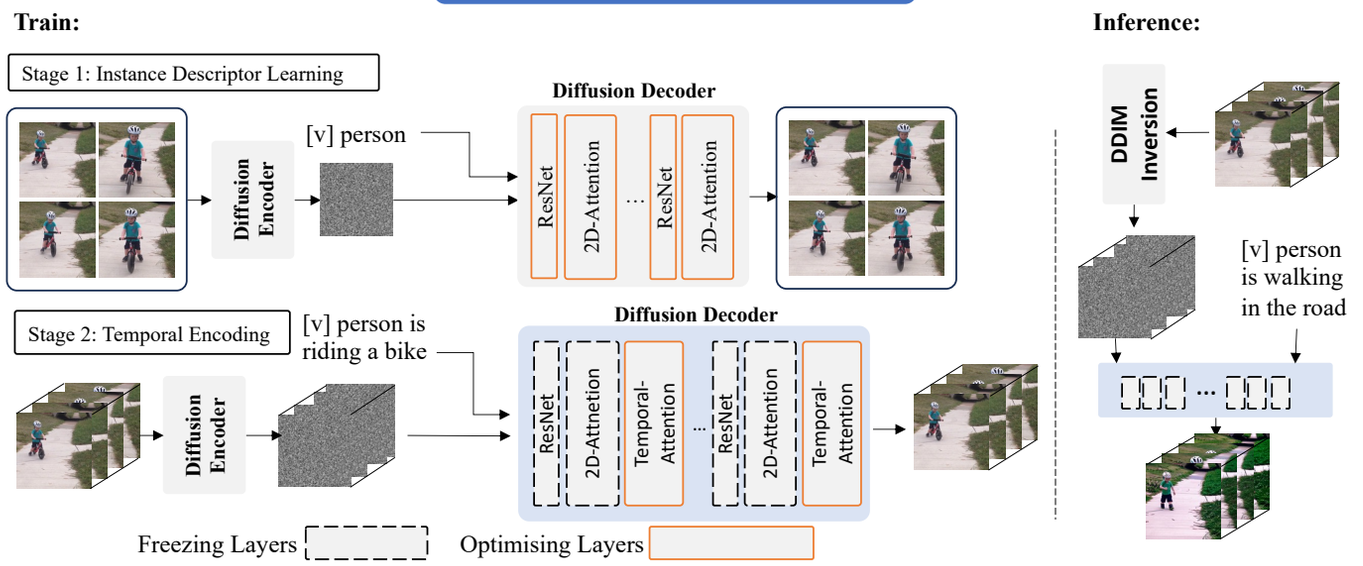
## 1. Problem Definition

The correlation between video moments and text is crucial for the task of **video moment retrieval (VMR)**, yet there is a scarcity of large-scale datasets.

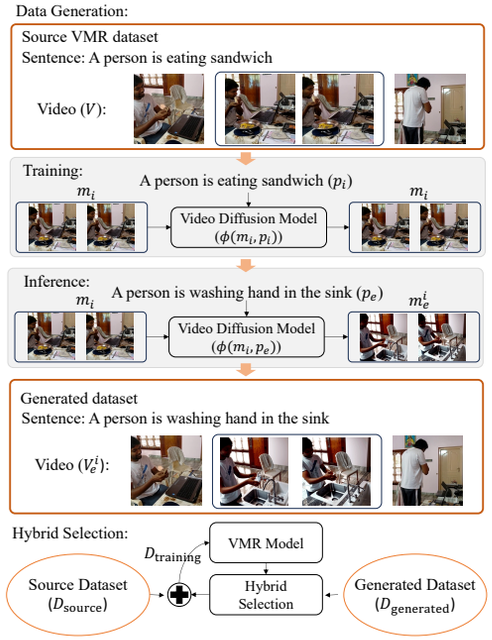
## 2. Solution

- A video diffusion model that synthesises training data
- A data selection module that selects beneficial data for the VMR task

## 3. Video Diffusion Model



## 4. Data Generation



## 5. Data Selection

Cross-modal relevance: $$s_c(p_e, m_e) = \frac{1}{N}\sum_{i=1}^{N} \cos(\text{VLM}(p_e), \text{VLM}(f_{m_e}^i))$$

Uni-modal structure: $$s_u(m_s, m_e) = \frac{1}{N}\sum_{i=1}^{N} \cos(\text{VM}(f_{m_s}^i), \text{VM}(f_{m_e}^i))$$

Model performance: $$D_{\text{mpd}} = \text{TOP}_l(\{(d, -\text{VMR}(d)) \mid d \in D_{cu}\})$$

## 6. Video Editing Ability

## 7. Conclusion

a. FVE is able to generate high-quality training data that benefits the VMR task (44.89%vs 44.01%)

b. FVE is able to change the action in a video and maintain other details.
